CY7C1062AV33

512K x 32 Static RAM

Features

- **High speed**
  - **— t_{AA} = 8 ns**
- **Low active power**
  - **— 1080 mW (max.)**
- **Operating voltages of 3.3 ± 0.3V**
- **2.0V data retention**
- **Automatic power-down when deselected**
- **TTL-compatible inputs and outputs**
- **Easy memory expansion with $\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ features**
- **Available in non Pb-free 119-ball PBGA package**

Functional Description

The CY7C1062AV33 is a high-performance CMOS Static RAM organized as 524,288 words by 32 bits.

Writing to the device is accomplished by enabling the chip ($\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ LOW) and forcing the Write Enable ($\overline{WE}$) input LOW. If Byte Enable A ($\overline{B}_A$) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{18}). If Byte Enable B ($\overline{B}_B$) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{18}). Likewise, $\overline{B}_C$ and $\overline{B}_D$ correspond with the I/O pins I/O_{16} to I/O_{23} and I/O_{24} to I/O_{31}, respectively.

Reading from the device is accomplished by enabling the chip ($\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ LOW) while forcing the Output Enable ($\overline{OE}$) LOW and Write Enable ($\overline{WE}$) HIGH. If the first Byte Enable ($\overline{B}_A$) is LOW, then data from the memory location specified by the address pins will appear on I/O_0 to I/O_7. If Byte Enable B ($\overline{B}_B$) is LOW, then data from memory will appear on I/O_8 to I/O_{15}. Similarly, $\overline{B}_c$ and $\overline{B}_D$ correspond to the third and fourth bytes. See the truth table at the back of this data sheet for a complete description of read and write modes.

The input/output pins (I/O_0 through I/O_{31}) are placed in a high-impedance state when the device is deselected ($\overline{CE}_1$, $\overline{CE}_2$or $\overline{CE}_3$ HIGH), the outputs are disabled ($\overline{OE}$ HIGH), the byte selects are disabled ($\overline{B}_{A\text{-}D}$ HIGH), or during a write operation ($\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ LOW, and $\overline{WE}$ LOW).

The CY7C1062AV33 is available in a 119-ball pitch ball grid array (PBGA) package.

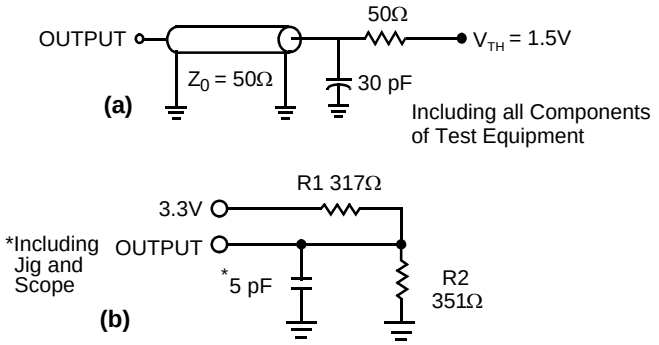
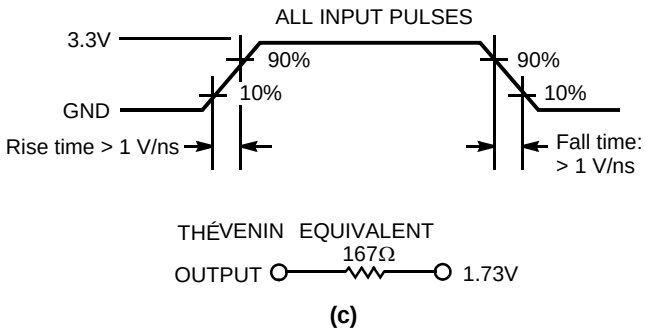
AC Test Loads and Waveforms[5]





Notes:

3. V_{IL} (min.) = –2.0V for pulse durations of less than 20 ns.
4. Tested initially and after any design or process changes that may affect these parameters.
5. Valid SRAM operation does not occur until the power supplies have reached the minimum operating V_{DD} (3.0V). As soon as 1 ms (T_{power}) after reaching the minimum operating V_{DD}, normal SRAM operation can begin including reduction in V_{DD} to the data retention (V_{CCDR}, 2.0V) voltage.

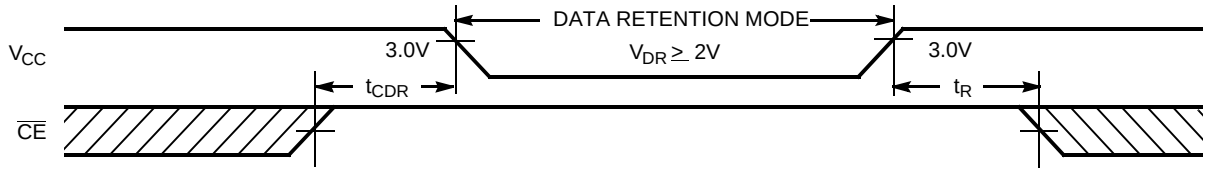
Data Retention Waveform

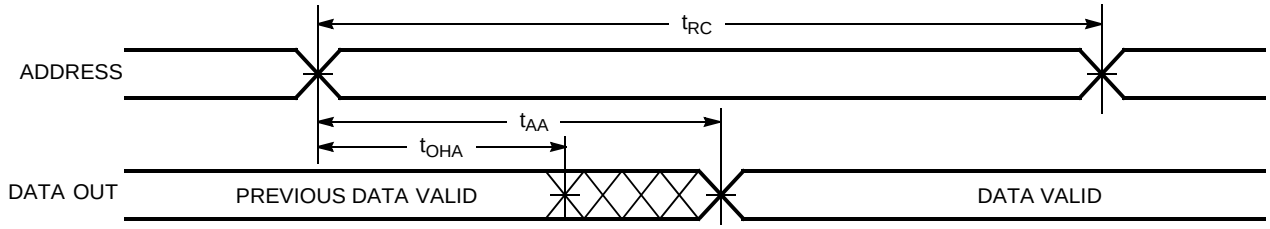


Notes:

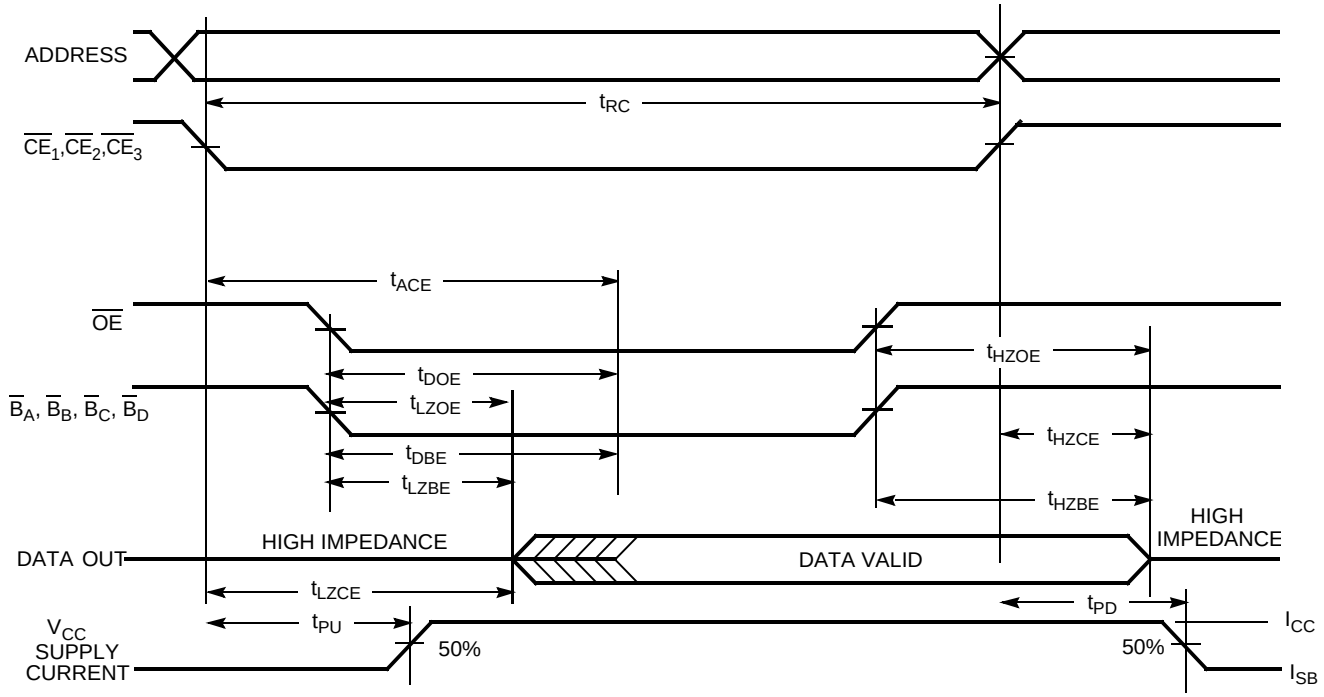
6. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and transmission line loads. Test conditions for the read cycle use output loading as shown in (a) of AC Test Loads, unless specified otherwise.
7. This part has a voltage regulator that steps down the voltage from 3V to 2V internally. t_{power} time has to be provided initially before a read/write operation is started.
8. t_{HZOE}, t_{HZCE}, t_{HZWE}, t_{HZBE}, and t_{LZOE}, t_{LZCE}, t_{LZWE}, and t_{LZBE} are specified with a load capacitance of 5 pF as in (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
9. These parameters are guaranteed by design and are not tested.
10. The internal write time of the memory is defined by the overlap of $\overline{CE}_1$ LOW, $\overline{CE}_2$ HIGH, $\overline{CE}_3$ LOW, and $\overline{WE}$ LOW. The chip enables must be active and $\overline{WE}$ must be LOW to initiate a write, and the transition of any of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.
11. The minimum write cycle time for Write Cycle No. 3 ($\overline{WE}$ controlled, $\overline{OE}$ LOW) is the sum of t_{HZWE} and t_{SD}.

Switching Waveforms

Read Cycle No. 1[12, 13]



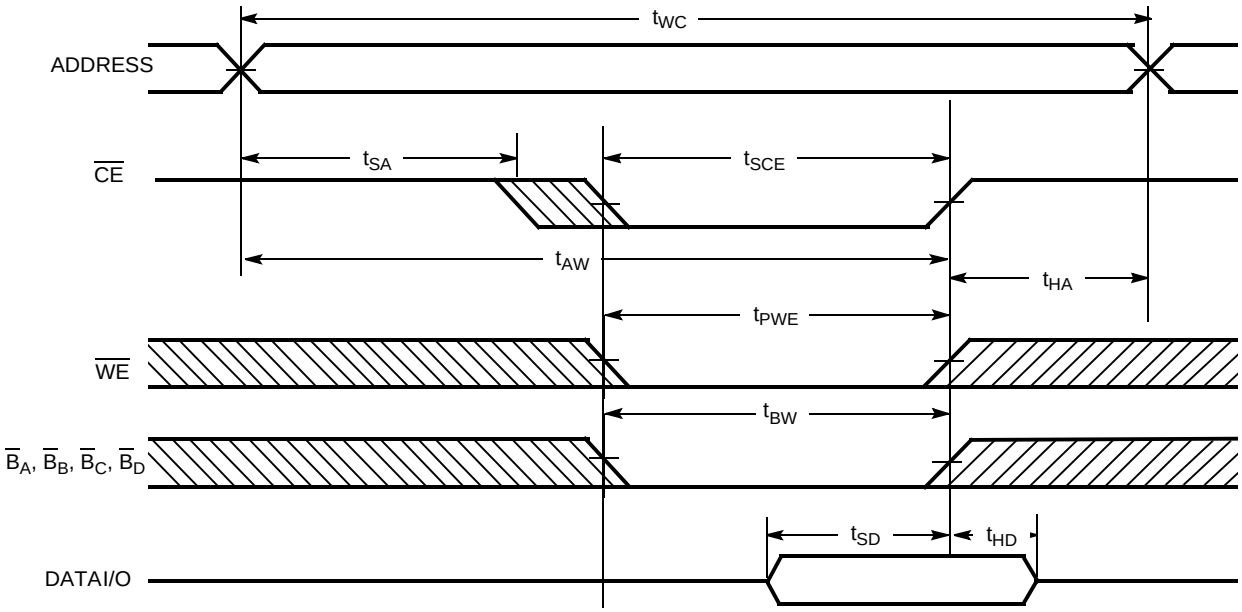
Read Cycle No. 2 ($\overline{OE}$ Controlled)[13, 14]



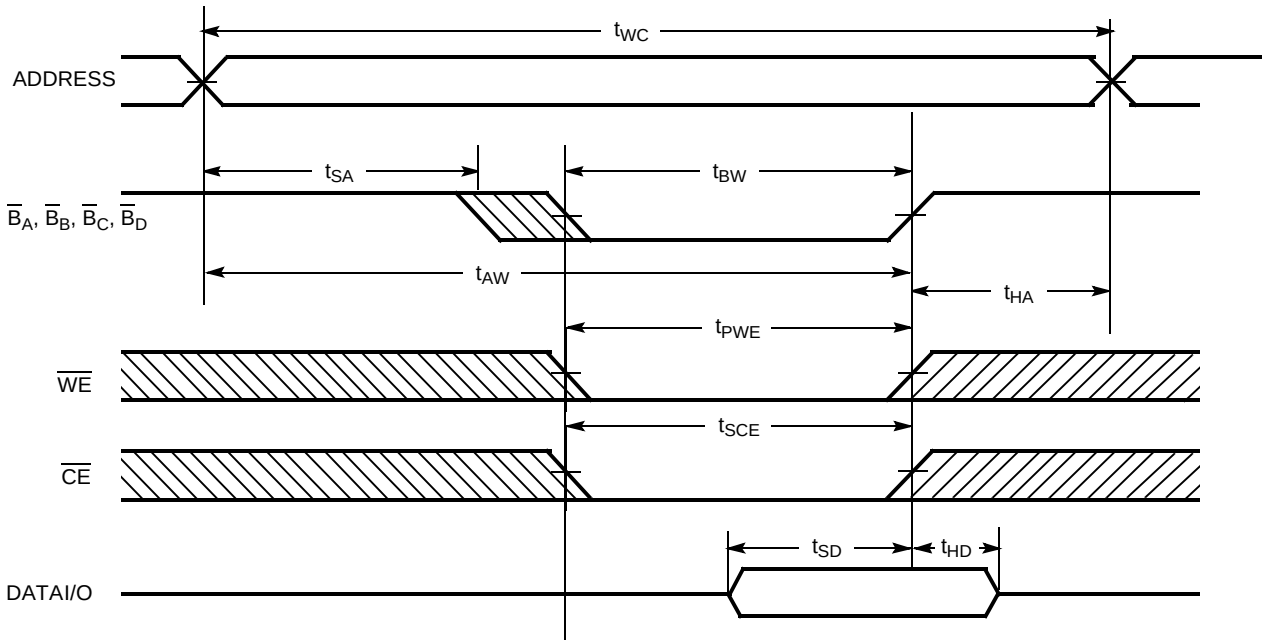
Notes:
12. Device is continuously selected. $\overline{OE}$, $\overline{CE}$, $\overline{B}_A$, $\overline{B}_B$, $\overline{B}_C$, $\overline{B}_D$ = V_{IL}.
13. $\overline{WE}$ is HIGH for read cycle.
14. Address valid prior to or coincident with $\overline{CE}$ transition LOW.

Switching Waveforms (continued)

Write Cycle No. 1 ($\overline{CE}$ Controlled)[15, 16, 17]



Write Cycle No. 2 ($\overline{BLE}$ or $\overline{BHE}$ Controlled)[15, 16, 17]



Notes:
15. $\overline{CE}$ indicates a combination of all three chip enables. When ACTIVE LOW, $\overline{CE}$ indicates the $\overline{CE}_1$, $\overline{CE}_2$, and $\overline{CE}_3$ are LOW.
16. Data I/O is high-impedance if $\overline{OE}$ or $\overline{B}_A$, $\overline{B}_B$, $\overline{B}_C$, $\overline{B}_D$ = V_{IH}.
17. If $\overline{CE}$ goes HIGH simultaneously with $\overline{WE}$ going HIGH, the output remains in a high-impedance state.

Switching Waveforms (continued)

Write Cycle No. 3 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW)
